

Program 4 Design

by Connor O'Neill, Estevan Pickett, Rene Franco, and Pablo Ruiz

i. Conceptual database design

Not seen in E-R Diagram:

Member IDs are set to be the next available value

Equipment has a constraint to the specific sizes and lengths for boots, poles, skis and snowboards.

ii. Logical database design

Member (MID, Name, PhoneNumber, EmailAddress, DateOfBirth, EmergencyContact)

- Primary Key: MID

SkiPass (PID, TotalUses, RemainingUses, PurchaseDateTime, ExpirationDate, Price, PassType, MID, IsValid)

- Primary Key: PID
- Foreign Key: MID references Member(MID)

Equipment (EID, Type, Status, SizeOrLength, IsArchived, CID)

- Primary Key: EID
- Foreign Key: CID references ChangeLog(CID)

ChangeLog (CID, Description)

- Primary Key: CID

EquipmentRental (RID, MID, PID, EID, RentalTime, Status)

- Primary Key: RID
- Foreign Keys:
 - MID references Member(MID)
 - PID references SkiPass(PID)
 - EID references Equipment(EID)

Trail (TID, Name, StartLocation, EndLocation, Status, Difficulty, Category)

- Primary Key: TID

Lift (LiftID, Name, OpenTime, CloseTime, Status)

- Primary Key: LiftID

LiftTrail (TID, LiftID)

- Primary Key: (TID, LiftID)

- Foreign Keys:
 - TID references Trail(TID)
 - LiftID references Lift(LiftID)

LiftUsage (UID, PID, LiftID, DateTimeOfUse)

- Primary Key: UID
- Foreign Keys:
 - PID references SkiPass(PID)
 - LiftID references Lift(LiftID)

Lesson (LID, Type, Difficulty, TimeOfClass, Duration, Price, IID)

- Primary Key: LID
- Foreign Key: IID references Instructor(IID)

LessonOrder (OID, MID, LID, NumberOfSessions, SessionsLeft, PurchaseDate)

- Primary Key: OID
- Foreign Keys:
 - MID references Member(MID)
 - LID references Lesson(LID)

Instructor (IID, EID, Certification)

- Primary Key: IID
- Foreign Key: EID references Employee(EID)

Employee (EID, PID, Name, Position, Demographics, StartDate, MonthlySalary)

- Primary Key: EID
- Foreign Key: PID references Property(PropertyID)

Property (PropertyID, Type, Name, MonthlyIncome)

- Primary Key: PropertyID

iii. Normalization analysis

Member Table

MID -> Name

MID -> PhoneNumber

MID -> EmailAddress

MID -> DateOfBirth

MID -> EmergencyContact

The Member table adheres to BCNF because every nontrivial FD is determined by MID, where MID is the superkey

SkiPass Table

PID -> TotalUses

PID -> RemainingUses

PID -> PurchaseDateTime

PID -> ExpirationDate

PID -> Price

PID -> PassType

PID -> isValid

PID -> MID

The SkiPass table adheres to BCNF because every nontrivial FD is determined by PID, where PID is the superkey

EquipmentRental Table

RID -> PID

RID -> EID

RID -> RentalTime

RID -> Status

EquipmentRental adheres to BCNF because every nontrivial FD is determined by RID, where RID is the superkey

Equipment Table

EID -> Type

EID -> Status

EID -> SizeOrLength

EID -> IsArchived

EID -> CID

Equipment adheres to BCNF because every nontrivial FD is determined by EID, where EID is the superkey

ChangeLog Table

CID -> Description

ChangeLog adheres to BCNF because every nontrivial FD is determined by CID, where CID is the superkey

Trail Table

TID -> Name

TID -> StartLocation

TID -> EndLocation

TID -> Status

TID -> Difficulty

TID -> Category

Trail adheres to BCNF because every nontrivial FD is determined by TID, where TID is the superkey

LiftTrail Table

(TID, LiftID) -> No Functional Dependencies

LiftTrail is in BCNF because the composite candidate key doesn't functionally determine any attributes

Lift Table

LiftID -> Name

LiftID -> OpenTime

LiftID -> CloseTime

LiftID -> Status

Lift adheres to BCNF because every nontrivial FD is determined by LiftID, where LiftID is the superkey

LiftUsage Table

UID -> PID

UID -> LiftID

UID -> DateTimeOfUse

LiftUsage adheres to BCNF because every nontrivial FD is determined by UID, where UID is the superkey

Lesson Table

LID -> Type

LID -> Difficulty

LID -> TimeOfClass

LID -> Duration

LID -> Price

LID -> IID

Lesson adheres to BCNF because every nontrivial FD is determined by LID, where LID is the superkey

LessonOrder Table

OID -> MID
OID -> LID
OID -> NumberOfSessions
OID -> SessionsLeft
OID -> PurchaseDate

LessonOrder adheres to BCNF because every nontrivial FD is determined by OID, where OID is the superkey

Instructor Table
IID -> EID
IID -> Certification

Instructor adheres to BCNF because every nontrivial FD is determined by IID, where IID is the superkey

Employee Table
EID -> PID
EID -> Name
EID -> Position
EID -> Demographics
EID -> StartDate
EID -> MonthlySalary

Employee adheres to BCNF because every nontrivial FD is determined by EID, where EID is the superkey

Property Table
PropertyID -> Type
PropertyID -> Name
PropertyID -> MonthlyIncome

Property adheres to BCNF because every nontrivial FD is determined by PropertyID, where PropertyID is the superkey

iv. Query description

Our query is "For a given LID (Lesson ID) display the Instructors Certification Level" The question it is answering is a concern a member might have in wanting the instructor for a lesson they are going to buy to be of a certain certification level. The utility of having this query in the system is so that a member can quickly see information about the Instructor according to a Lesson rather than just the Lesson's difficulty level.
